

Tools Introduction

Dominik Gresch

Overview

symmetry-representation

- **Goal:**

Describe symmetry operations, create representation matrix

$$\mathcal{H}(\mathbf{k}) = D(g) \mathcal{H}(g^{-1}\mathbf{k}) D(g^{-1})$$

needs: representation matrix

real-space matrix

TBmodels

- **Goal:**

Evaluate and modify tight-binding models

- **Features:**

- Efficient evaluation
- Parse to / from different formats
(e.g. Wannier90 output)
- Symmetrization

TBmodels: Symmetrization

- Calculates group average:

$$\tilde{\mathcal{H}}(\mathbf{k}) = \frac{1}{|G|} \sum_{g \in G} D^{\mathbf{k}}(g) \mathcal{H}(g^{-1}\mathbf{k}) D^{\mathbf{k}}(g^{-1})$$

$$\frac{1}{2} \left(\begin{array}{ccccc} \bullet & \bullet & \bullet & & \bullet & \bullet & \bullet \\ & \color{blue}{\rule{0.5cm}{0.4pt}} & \color{red}{\rule{0.5cm}{0.4pt}} & & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ \bullet & \bullet & \bullet & + & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ & \color{blue}{\rule{0.5cm}{0.4pt}} & \color{red}{\rule{0.5cm}{0.4pt}} & & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ \bullet & \bullet & \bullet & & \bullet & \bullet & \bullet \end{array} \right) = \begin{array}{ccccc} \bullet & \bullet & \bullet & & \bullet & \bullet & \bullet \\ & \color{blue}{\rule{0.5cm}{0.4pt}} & \color{red}{\rule{0.5cm}{0.4pt}} & & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ \bullet & \bullet & \bullet & = & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ & \color{blue}{\rule{0.5cm}{0.4pt}} & \color{red}{\rule{0.5cm}{0.4pt}} & & \bullet & \color{blue}{\rule{0.5cm}{0.4pt}} & \bullet \\ \bullet & \bullet & \bullet & & \bullet & \bullet & \bullet \end{array}$$

- Condition: Tight-binding *basis* must be complete under symmetry

kdotp-symmetry

- **Goal:**

Create $\mathbf{k} \cdot \mathbf{p}$ *basis* which respects given symmetries

$$\mathcal{H}(\mathbf{k}) = D(g)\mathcal{H}(g^{-1}\mathbf{k})D(g^{-1})$$

Z2Pack

- **Goal:**

Calculate topological invariants (Chern number, Z2 invariant)

Tracks Wannier charge center / Wilson loop eigenvalue evolution across a surface

PhaseMap

- **Goal:**

Calculate a phase diagram with minimal number of phase evaluations

Requires a function to evaluate the phase at a given point

NodeFinder

- **Goal:**

Find and classify all nodal features in a potential landscape (use case: band gap closures)

AiiDA plugins

- What is AiiDA?
 - Workflow / automation framework
- Pro:
 - Allows for high-throughput calculations
 - Creates “provenance graph” of calculations
- Con:
 - Significant learning curve
 - Overhead of creating plugins
 - Additional complexity: non-zero chance of bugs

AiiDA plugins

- Is it for me?
 - For things which could also be done (reasonably) by hand: no
 - Larger / more complex runs: yes

AiiDA plugins

- aiida-tbextraction:
 - plugin for calculating tight-binding models from first-principles calculations
 - optimize Wannier90 energy window
 - includes symmetrization procedure
- Modular workflow design: [Link](#)

Documentation: Links

Coding Guidelines

- Scientific code is a mess – and that's fine
- Code to solve problems, *refactor* to create tools

Coding Guidelines

- “Unix philosophy”: small tools which do one thing well
 - In hindsight, maybe fewer separate *repositories* would be simpler
- Design from the user perspective
 - think about how to use the code first
 - write ~~extensive~~ sufficient documentation

Coding Guidelines

- Checkpoints: invaluable for longer-running calculations
 - include them in your design from the start
 - no, `pickle` is not a long-term storage format
- Use unit-testing, static code analyzer, code formatter, ...
 - can be a pain to use, but worth it in the long run
